Introducing the NEW 'Tri-Air' Single blade volume control damper

- A 100% British designed and manufactured product
- Unique, spring release/locking mechanism
- Extended handle support for ease of insulating
- Patent applied for – application no: 0903565.0

Tri-Air Innovations single blade volume control damper

The unique Tri-Air Damper is now in full production for the UK duct market, where it is already experiencing a strong demand.

The product combines the simplicity of a single blade damper with the demands of blade setting accuracy and product reliability, yet is available at a market price equivalent to the most basic dampers around.

The Tri-Air Damper is designed for the Circular/Spiral Duct market and will slot easily into all proprietary brands. The spring release handle mechanism enables dampers to be accurately set in many different positions between open and closed, and will not slip or rattle even under the most hostile conditions.

In addition, the cleverly designed handle support structure has recessed elevations to allow for the unobstructed installation of duct lagging without disturbing the mechanism. This makes lagging far easier, both during duct erection or on retrofit applications.

What is also very significant is that the product has been designed and manufactured solely within the UK and will more than match any imported products for quality and price value. Local production also ensures continuous product supply and stable pricing unaffected by constant exchange rate variances.

The product conforms to current DW 143/144 specifications.

Demand can be comfortably met from stocks being held throughout the UK. In addition, overseas agents will be appointed to develop the export markets.
